

Ecommerce Chatbot

Future Works -

Improving Past Chat Management

Right now, the past chat feature works but isn't as smooth as I want it to be. When you click on a previous query, it doesn't always take you to the right spot or hold the scroll properly. I plan to make it more interactive — so that clicking on an old question instantly takes you to that exact chat message with a short glowing animation. The idea is to make exploring past queries feel effortless and visually clear.

Adding More Visualization Options

Currently, the chatbot can create basic charts like bar, pie, line, and area graphs. In the future, I want to expand this by adding more visualization types — like scatter plots, heatmaps, and trend dashboards — so users can get a much deeper and customized view of their data. The goal is that you can simply ask for any type of chart in natural language, and the chatbot will create it automatically.

Making the Chatbot Smarter and Faster

The chatbot already understands most user queries, but I want to make it even more intelligent. In the next stage, I'll focus on improving how it handles complex, multi-part questions and generates optimized SQL queries behind the scenes. I also plan to include some optimization techniques so that responses become faster and more accurate, making the overall experience feel more like chatting with a real data analyst.
